EXERCISE 1

- Input a text in the console.
- Count the number of times the "abc" pattern appears in a string.

Q1: What will be the **result** for these outputs?

Input	Output			
abbcdef				
abcfabc				
adabcfbc				
Q2: Choose the more relevant blocks and draw your structure flowchart.				
Q3: Adapt code from a previous session to solve this p	problem.			

EXERCISE 2

- Input a text in the console, only number.
- Multiple all the number before the first apparition of 6 and 1 if 6 is in the first position.

Q1: What will be the **result** for these outputs?

Input	Output
123456789	120
5263	10
71256	
45	
625	

									_
Q	Q2: Draw your structure flowchart.								

Q3: Use the following code and adapt it so as not to use the repetitive (for) loop.

```
word = input()
i = 0
mult = 1
while i < len(word) and int(word[i]) != 6:
    mult *= int(word[i])
    i += 1
print(mult)</pre>
```

EXERCISE 3

- Input a number.
- Display numbers from 1to that number

Input	Output				
4	1234				
2	12				
5					
3					
0					
Q1: Create a flowchart to solve this problem. Which lo	oop block will you choose and why?				
Q2: Review the code and find the error and explain th	nem.				
number = int(input()) result = ""					
for index in range(number): result = result + " " + str(index + 1)	for index in range(number):				
print(result)					
Q3: Write your own good code to solve this problem. This time, you can't use the for condition.
